

All aboard

Trains whoosh along railways tracks, carrying passengers between stations, or cargo in wagons.

Signals tell drivers when it's safe to go.

The first trains, built around 200 years ago, were powered by steam engines.

Freight trains pull wagons loaded with bulky cargo.

Passenger trains are made up of several coaches linked together.

The driver controls the train from a cab at the front.

Some passenger trains reach speeds over 300km/h (185mph).
